Paul G. Mezey: New Developments in Molecular Chirality

Some of the new developments in molecular chirality have been truly fundamental to the theoretical understanding and to the actual practice of many aspects of chemistry. The progress in this field has been very rapid, even accelerating in recent years, and a review appears more than justified.

adsorption capacity of molecular sieves decrease with temperature increase also much slower than others adsorbents. See figure 5. The adsorption of different molecules by Molecular Sieves is affected by the following parameters: 1. Zeolite type. 2. Effective pore diameter. 3. Molecular shape and its critical diameter. See table 1. 4.

is also expanding. With improved molecular diagnostic techniques, we are beginning to find mutations in malignant salivary gland tumors that may offer molecular targets. This could be particularly important for aggressive salivary gland tumors, such as salivary duct carcinoma (SDC). This article will focus on some of

New chiral molecular sieves may lead to production of better drugs. This discovery opens new areas of investigation in both chemistry and biology, and has broad implications for pharmaceutical companies and other specialized chemical manufacturers. A trait common amongst the molecules in cells is chirality.
