Calculus (from Latin calculus, literally 'small pebble', used for counting and calculations, as on an abacus) is the mathematical study of continuous change, in the same way that geometry is the study of shape and algebra is the study of generalizations of arithmetic operations.. It has two major branches, differential calculus (concerning instantaneous rates of change and slopes of curves ...

In mathematics, matrix calculus is a specialized notation for doing multivariable calculus, especially over spaces of matrices. It collects the various partial derivatives of a single function with respect to many variables, and/or of a multivariate function with respect to a single variable, into vectors and matrices that can be treated as single entities.

This book worked great with my class. Very similar to the previous edition so if you need to save money, you could get the older one. It's always recommended that if you've been assigned problems to check out the edition on reserve in your college library just to make sure the numbering hasn't changed.

Remarkably, the first 6 terms (!) of the power series for this formula (with respect to e^2) coincide with the corresponding terms in the exact expansion given above. It's only with the coefficient of e^{12} that things start to differ slightly: The correct coefficient of e^{12} is $-4851/2^{20}$ whereas Ramanujan's formula gives $-9703/2^{21}$, for a discrepancy approximately equal to $-e^{12}/2^{21}$.
